

# How to stretch a picture to fill the whole page?

Dawid Weiss

April 12, 2006

## 1 Solution using **textpos** Package

Perhaps the simplest way to do it is with `textpos` package using the `absolute` option.

Note that if you are already using `textpos`, then it may be difficult to position the box absolutely.

## 2 Solution by PDF inclusion

This solution is perhaps even better (if you're using `pdflatex`). Just include a PDF page directly in the generated document. You'll need `pdfpages` package for that. To create a PDF from an image (JPG or PNG), use GIMP to save it as an EPS file and then convert the EPS to a PDF with GhostScript or anything else.
