

An example on the ‘top’ level:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

- And now indented:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

- And indented again:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

And now not indented (note it is the same option for fancyvrb and listings – resetmargins). An example on the ‘top’ level:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

- And now indented:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

- And indented again:

```
1 public final class Example {  
2     public static void main(String [] args) {  
3     }  
4 }
```

Now, if we want an arbitrary horizontal indent, we can specify that as well. For example, to indent code blocks *exactly* the amount of a typical list environment, you would do this:

- Here is a list indent. The code below is not in the list, yet it appears exactly at the same distance from the left page margin.

```
public final class Example {  
    public static void main(String [] args) {  
    }  
}
```
